Co-authorship is generally expected when core personnel have made significant contributions to the research in the form of consultation, experimental design, method development, data analysis and/or data interpretation. Significant can be defined as “the project would not have progressed, or progressed at a substantially slower pace, without the guidance of facility personnel”. In such cases, core personnel should have the opportunity to review and edit the appropriate sections of a manuscript before submission.

Acknowledgement of facility contributions is expected in publications that include any data generated in the facility. Acknowledgement helps us demonstrate the impact we contribute to the research community, and it helps tremendously in our future effort to secure funding to bring you even more instruments and services.

Please inform us when publications are accepted and forward us a copy for our records. We may also post citation information on our website.
